

A SHORT SUMMARY ON COVID-19 DATASET

Date: July 9, 2020

To: Aninda Halder, Software Engineer (AI, ML). Ajkerdeal

From: Md. Hasibul Islam, Intern applicant

Subject: Findings on Covid-19 data analysis

As I have analyzed the **Covid-19** dataset collected from Kaggle, I have found out some facts. Africa has the most countries affected but North America (basically USA) has the highest number of affected cases and deaths. Situation in South America (mostly Brazil) and North America are worst currently. Poorer countries like South American continent and African continent and some of Asia continent's countries are missing a large number of total cases, deaths, critical cases and recovery data as they are not able to do tests like the rich countries. Europe had the most tests done per million, that shows their economic position in the world. But in case of deaths per million Europe has the worst position. Although now they are in a good position. USA, Brazil, Russia, India are now current hot zone. Asia is going to be the next hit zone of this pandemic as it has now most critical cases, active cases, and new deaths. Although good news is Asia is having the most recovered cases around the world. All over the world, most of the countries are now in very good position, except countries like USA, Brazil and rising Asian countries. The number of total cases, total deaths, total recovered, total critical cases and total tests are strongly related with each other. This virus has no relation with the population as the most populated countries like India, China are not on the top. USA and Brazil are passing a tight moment right now and this may go on for a month or two as there's no lock down situation there. If no vaccination coming up, surely Asia is going to be the next hit zone of this pandemic.
